

Empty directory. Proof-carrying application.

One manifest connects runtime, evaluation, browser QA, and proof.

- Two presets; one path
- Local run: 37.221 s
- GitHub source; npm blocked

The hard part is keeping every proof gate on one execution path.

Parity breaks when benchmark, browser, deployment, and public claims follow different implementations.

01 One implementation must serve every gate

02 Receipts bind the exact revision

03 Failed gates stay visible

Two presets passed the full factory path in 37.221 seconds.

From empty directories, NodeKit installed, compiled, ran, evaluated, benchmarked, and proof-checked both presets.

37.221 s

01 Agentic RL preset: passed

deterministic local factory acceptance

02 SMB lending FDE preset: passed

03 Local benchmark, not production latency

The Casca lab passed every local gate without making a credit decision.

On commit 6c8d7d9, the synthetic lab passed deterministic, live-provider, browser, reload, export, and identity gates.

query → **proposal** →
approval → **export**

01 One bounded live-provider call

02 Fresh browser plus reload

03 Deployment gate still open

Protect the scorer first; train only after its boundaries are credible.

The current baseline is behavior cloning, not RL. It passed protected local evaluation; the strict Azure-only live route failed closed with no fallback.

01 Behavior cloning only

02 Nine reward attacks blocked

03 Azure/ZDR route: HTTP 404; no fallback

9

adversarial reward attacks blocked

Founder Quest passed all 15 hosted checks on one exact production revision.

Production screenshot; verified scope remains synthetic and read-only.

Read-only Founder Quest connects quests, a bounded graph, sourced answers, authority boundaries, and proof in four isolated browser contexts.

01 Source dc5fba2 · evidence 0457913

02 App/config 973ea7cb · graph ng1_c9334138

03 18 / 18 tests · 25 / 25 artifact hashes

A real grant scenario tests the graph without claiming biological proof.

Anthropic's rare-disease grant is an independent forcing function for mapping research, novelty, evaluation, authority, and readiness, not an affiliation.

01 Official grant announcement

02 No affiliation or endorsement

03 Research synthesis does not prove biology

**source → claim →
evaluation →
application
readiness**

Loops need external anchors. Bring one workflow and inspect the proof.

Research, build, evaluation, proof, presentation, and feedback can watch one another. Only external anchors close the graph.

01 Researcher, builder, or operator

02 Sources, commits, exports, and outcomes

03 Inspect pass, fail, and human-review status

**research ↔ build ↔
evaluation ↔ proof**
